Construction Costs \$7M

PROJECT OVERVIEW

MNS Engineers provided oversight and inspection for 30 CES at Space Launch Complex 6 (SLC 6) for a new Security Management System (SMS).

This work included daily monitoring and inspections for the new security perimeter chain link fence, gates, turnstiles, barbed wire intrusion barrier and repair of the animal control fencing.

Electronic sensors, closed circuit television cameras, site perimeter lighting and electronic security management components were major items of installation. These work elements required underground trenching and boring for new equipment fiber and electrical power conduit runs inside the secured fence line. Fiber splicing and field distribution boxes were installed with the new camera towers.

Electronic sensors (foids) were installed on all the new interior perimeter fences. MNS observed and witnessed all preliminary testing of

the security system for compliance with specifications. The VAFB Security Forces performed final testing of the security equipment that was installed.

MNS assisted the contractor with guidance regarding environmental issues, waste management practices, access to the site, as-built drawing requirements, safety issues, and all phases of construction at the contractor's request.

SERVICES PROVIDED

Construction Management

- IDIQ Title II Construction Management Services

PROJECT ELEMENTS

- environmental issues
- security
- surveillance
- trenching
- utilities
